

How to Initialize Git with Git bash

1. Create project folder, example `Johannes_project`
 1. Inside `Johannes_project` folder, create `logbook.md` and the following folders: `data`, `results`, `screenshots`, `scripts`.
 2. Inside `scripts`, copy and paste `signature.ps1`, `signature.sh`.
2. Open `Johannes_project` with Git bash. Inside `Johannes_project`, initialize Git for version control:
 1. Command: `git config --global user.name "Johannes Noyan"`
 2. Command: `git config --global user.email "johannes_noyan@outlook.com"`
 3. Command: `git config --global push.default matching`
 4. Command: `git config --global alias.co checkout`
 5. Command: `git init`
3. Open `Johannes_project` with Git bash. Inside `Johannes_project`, turn off automatic line break conversion:
 - o Command: `git config --global core.autocrlf false`
4. Open `Johannes_project` with PowerShell. Inside `Johannes_project`:
 1. Command: `New-Item -ItemType File -Path .gitattributes`
 2. Command: `notepad .gitattributes`
 1. Insert these line:
 - `*.sh text eol=lf`
 - `*.ps1 text eol=crlf`
 2. Save `.gitattributes`
5. Open `Johannes_project` with Git bash. Inside `Johannes_project`, add all your code into your local repository:
 1. Command: `git status`
 2. Command: `git add .`
 3. Command: `git status`
 4. Command: `git commit -m "Initial commit: repo structure and logbook template"`
 5. Command: `git log --oneline`
6. Push your local repository of your code to Github:
 1. If you do not have a ssh directory, create one.
 2. Command: `mkdir /c/Users/johan/.ssh`
 3. Command: `cd /c/Users/johan/.ssh`
 4. Command: `ssh-keygen.exe`
 1. Generate a ssh key.
 5. Save the key inside `.ssh` directory.
 6. You do not need to create password for the ssh key.
 7. We are interested in `id_rsa.pub` because that is the one we are going to upload to Github.
 8. Command: `cat id_rsa.pub`
 9. Copy the entire text, from top to bottom.
 10. Go to `github.com` → Settings → "SSH and GPG keys" → Title: "whatever you want", Key: right click and paste in the `id_rsa.pub`.
 11. Now create a repository → Repositories → New → "Repository name": `Johannes_project` → Public
 12. Don't initialize it with a README, license, or `.gitignore`, if you're pushing an existing project.
 13. "Create repository".
 14. Connect your terminal to your Github repository.
 1. ".. or push an existing repository from the command line"
 2. Command: `git remote add origin git@github.com:flatplanet/twitterly2.git`
 3. Command: `git branch -M main`
 4. Command: `git push -u origin main`

5. Click the "Authorize git-ecosystem" green button.
15. You just completed "Initialize Git with Git bash" tutorial.
16. From now on, if you want to upload your local Git repository to your Github repository
 1. **Command:** `git push`
